

1) Complete these part-whole models. Show your working out using common denominators. Simplify fractions where possible.

2) Here is a pile of cat treats.

Milo ate $\frac{3}{8}$ of the cat treats.	Bella ate $\frac{5}{12}$ of the cat treats.	Oscar ate $\frac{1}{16}$ of the cat treats.

What fraction of the treats are left for Meeko? _____

1) Hifi has arranged his cat treats into fraction calculations.

$$\frac{1}{8} + \frac{1}{9} = \frac{17}{72}$$

$$\frac{4}{9} - \frac{5}{12} = \frac{1}{36}$$

$$\frac{1}{9} + \frac{1}{10} = \frac{2}{90}$$

$$\frac{2}{9} - \frac{1}{7} = \frac{1}{63}$$

$$\frac{3}{5} + \frac{3}{8} = \frac{6}{40}$$

$$\frac{11}{12} - \frac{4}{7} = \frac{7}{84}$$

$$\frac{4}{7} - \frac{1}{2} = \frac{1}{14}$$

$$\frac{2}{5} + \frac{5}{9} = \frac{43}{45}$$

$$\frac{4}{5} - \frac{1}{7} = \frac{23}{35}$$

Prove if each calculation is true or false. Show your reasoning.

2)

I think the shaded fraction of box C is five eighths.

- a)

one quarter	
-------------	--
- b)

	three eighths	
--	---------------	--
- c)

	?	
--	---	--
- d)

	$\frac{1}{16}$
--	----------------

Do you agree with Mildred the cat? Explain your reasoning.

1)

$$\frac{1}{\square} + \frac{\square}{12}$$

The cats have completed this calculation in different ways using only the digits above. Are their statements correct? Prove it.

There are seven fraction calculations that have an answer with a denominator of 12.

a) _____

There are six fraction calculations that have an answer with a numerator of 7.

b) _____

The biggest denominator number you can have in the answer is 84.

c) _____
